

INFORMATICA CLOUD DATA ORCHESTRATION IMPLEMENTATION

BUSINESS OBJECTIVES

The customer was challenged with highly inefficient data collection and manual processes across multiple systems to build daily, weekly finance and operational reports resulting in data inconsistency, inaccuracy, incompleteness and operational efficiency. Customers wanted to integrate their ERP, CRM, Supply Chain, Finance, manufacturing and planning application in real-time to begin with.

SOLUTION

Infometry built the solution for the entire tools group to provide Informatica as a PAAS that combines EDR application and other data integration services enabling users to self-development execution and governance of integration workflows among on-premise or cloud-based applications as well as traditional and newer data protocols.

SUCCESS CRITERIA & BUSINESS VALUE

This helped customers to unify cloud data with the rest of the enterprise data and ensure maximum value from SaaS investments. The benefit came from bulk and real-time integration on one platform.

TECHNOLOGIES USED

Informatica IDMC
